VET SURGICAL AND MEDICAL SUPPLIES

2022
CATALOGUE

Our philosophy

At Vet Surgical and Medical Supplies, we have a simple philosophy that revolves around your patients and your client's best friends. We want every sick or injured animal to get the treatment that they need and minimise the cost of products to vets so they can pass the saving on and save more animals lives.

Our products

We aim to supply great quality products more affordably than anyone else without any compromise to quality. Every product we stock has been tested and quality assured by actual Australian vets. Our catalogue is growing by the day and we are always happy to investigate something for you if we don't currently stock it.

Our brands

We are the sole distributors for both INNOPLANT and Eickemeyer, both out of Germany. INNOPLANT specialises in quality products ranging from total hip and knee replacement instruments and implants to TTA Jump! Wedges. Eickemeyer has a full suite of veterinary products, most notably ZLIG and other cruciate repair systems (TPLO and TTA) as well as a full range of other orthopaedic products.

Eickemeyer®

TTA Jump!

SCREWLESS TIBIAL TUBEROSITY ADVANCEMENT

Fundamentals

Two hemicylindrical anchors distribute the tensile load of the patellar tendon directly from the tuberosity to the tibia, via the implant. This reduces the load of the relatively weak bone near the Maquet Hole.

The implant contains a curved, anatomically aligned design. In comparison to a flat geometry, the curved shape creates additional radial directed forces when tensile forces are loaded. The radially directed forces create anchorage between the tuberosity, TTA cage and tibia, and stabilize the implant position.

The mechanical advancements ensure the needed stabilization without the need for screws, for secure and safe positioning. The screwless design reduces the risk of fractures close to the screws, as well as speeds up the procedure.

Intraoperative customisation

The implant can be customised during surgery extremely easily. The necessary implant width can be adjusted by cutting the TTA cage. Three or four different widths are possible depending on the size of the implant.

The ability to change the width of the implant mid-surgery increases the flexibility of the technique and reduces investment in inventory.

Properties

- ▶ **Material:** Titanium alloy (TiAl6V4, ISO 5832-3, US-Standard ASTM F136)
- ▶ **Surface:** Blasted
- ▶ **Sizes:** 3.0mm to 15mm left and right

ZLIG INTRA-ARTICULAR CRUCIATE LIGAMENT REPLACEMENT

The History

The tear of the cranial cruciate ligament is still one of the most common orthopaedic diseases in dogs. The path of the many surgical methods developed for this vary between intracapsular and extracapsular techniques to modern corrective osteotomies that alter the geometry of the affected knee joint. With the development of new materials in medical technology, it is now possible to replace the cranial cruciate ligament in an anatomically correct manner, instead of changing the forces acting on the joint. After a long period of preparatory work by the French Dr Jacques-Phillipe Laboureau, a suitable synthetic ligament is now available for the intra-articular cruciate ligament replacement in small animals. Together with the instrumentation developed by EICKEMEYER®, this new technique for cruciate ligament replacement can now be performed.

The Implant

The Zlig consists of ultra-high-molecular polyethylene with the special feature that the woven structure of the implant is interrupted intra-articularly by "free fibres". Free parallel fibres reduce fatigue and encourage the ingrowth of fibroblasts and collagen. Each implant is delivered in a sterile packed sleeve, making it easier to handle the implant before it is inserted into the joint. A selection of sizes with different resistances and fibre lengths are available to fit different patient sizes.

The technology

In this technique, an artificial ligament is used as a total replacement for the cranial cruciate ligament using tunnel-tunnel technique. The ligament is fixed in the tibia and Os femoris using specially developed cannulated interference screws in drill channels. The screws are guided parallel to the ligament using a guiding wire to avoid deviations. The technology does not cause irreversible damage and the results are reproducible thanks to a quick learning curve. Another great advantage of the technique is the fact that patients can put weight on the hind leg immediately after the operation without any risks.

ZLIG INTRA-ARTICULAR CRUCIATE LIGAMENT REPLACEMENT

The instrumentation

A small and inexpensive set of instruments is required to perform this new and innovative cruciate ligament surgery method. The threads of the specially developed titanium interference screws are round so they do not cause any damage to the fibres of the Zlig.

ZLIG Interference screws are cannulated and come in a range of sizes and lengths that are designed specifically for the ZLIG technique.
